

- Flexible and guaranteed comfort in all conditions
- Easy to use
- Increased system reliability
- Prompt corrective and emergency actions
- Energy optimisation
- Increased system service life
- Start-up via WEB

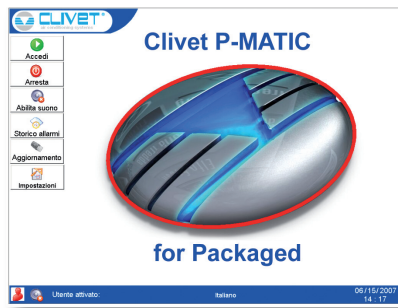

Clivet P-MATIC for Packaged

Supervision System specialised in the management of packaged climate control systems with Clivet heat pumps

Clivet P-MATIC for Packaged

Supervision System specialised in the management of packaged climate control systems with Clivet heat pumps

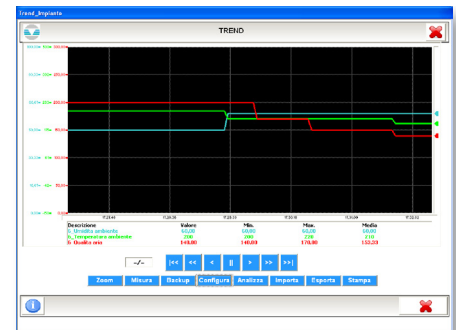

For over a decade, Clivet has been successfully developing complete climate control systems, comprised of a range of specialist heat pumps, the installation supervision system able to boost efficiency and reliability, and the numerous user services.

Clivet P-MATIC for Packaged is the Clivet-designed supervision system for monitoring its climate control units installed in small and medium shopping centres, supermarkets, hypermarkets, theatres, museums and similar locations.

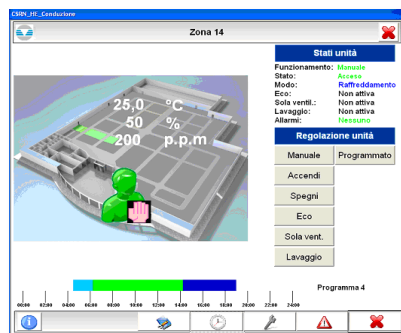

When installed in a climate control installation system, the **Clivet P-MATIC for Packaged** application enables a proper maintenance policy. In fact, it is able to guarantee a number of significant advantages, including:

- An adequate and constant level of service in terms of employee and customer comfort, hygiene and safety
- The complete peace of mind of the personnel responsible for running the centre, meaning that they can focus on more important jobs
- Reduced costs for corrective or emergency actions
- Prompt and effective corrective and emergency actions
- No more wasted energy and a consequent reduction in environmental impact
- Extended system service life

Clivet P-MATIC for Packaged can be used to manage:

- Switching the machine on and off automatically or manually
- The unit operating status
- The unit alarms
- The temperature setpoints
- The relative humidity setpoints
- Operating trend display and print-outs

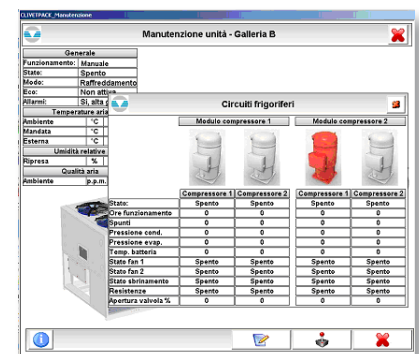

Each piece of equipment can be manually or automatically controlled using the scheduler. The supervision system makes it possible to achieve a totally "transparent" picture of each unit's operation, to control the units on an individual basis, either manually or automatically, and to observe the presence of alarms in real time, as well as to carry out rapid fault finding.

The software has user-friendly 3D graphics and enables the immediate identification of the rooms and units in question. "Navigation" can take place in two different ways: "physically" by zone and/or "logically" by function. Information on the system status is requested constantly by the supervision software and displayed on animated video pages.

Clivet P-MATIC for Packaged is entirely developed and manufactured by Clivet and undergoes individual testing before delivery. The supply typically comprises:

- Supervision workstation, complete with professional Personal Computer with high frequency Intel processor, high resolution TFT monitor, DeskJet A4 printer, convertor box for RS485 serial communication and ADSL or modem remote control system.
- Control and supervision software
- Navigation menu customisation comprising graphic representations of the building in 3D and by individual floor.

Each system also comes with the Clivet check-up, training and start-up.
